

SPECIFICATION CONDITIONS

This document contains specifications and supplemental information for the Model PA3000 Power Analyzer. Specifications are the standards against which the Model PA3000 is tested. Upon leaving the factory, the Model PA3000 meets these specifications. Supplemental and typical values are nonwarranted, apply at 23 °C, and are provided solely as useful information.

Source and measurement accuracies are specified at the Model PA3000 terminals under these conditions:

1. 23 °C ± 5 °C, < 70 percent relative humidity
2. After a one-hour warm-up period
3. A/D autozero enabled
4. Averaging set to 10
5. Calibration period: One year

³ To meet specifications in Integration Mode, the unit must be in a fixed range with autozero off

⁴ External shunt impedance is $\leq 10 \Omega$

⁵ Low Bandwidth is on for accuracy specifications < 850 Hz, if High Bandwidth is on then add 0.1 % of range to the specification

⁶ If autozero is off, then add 85 μA of offset for the 1 A Shunt, 8.5 mA for the 30 A Shunt, or 360 $\mu V/Z_{ext}$ for the external shunt

⁷ Specifications are valid only when applicable voltage and current inputs are > 1 % of range

⁸ Typical performance

⁹ Signal level of the frequency source over 50 kHz must be > 25 % of range, otherwise results will show as zero

¹⁰ High Bandwidth is on for accuracy specifications > 850 Hz

¹¹ External shunt limited to $\leq 100 \text{ kHz}$

¹² Typical Spec. Measurement should be > 75% of full scale. To optimize performance on the 50 mV range for external shunt, turn the filter on

¹³ If autozero is off, then add 20 mV of offset
